CLAIMS:

What is claimed is:

- 1. An apparatus comprising:
- a host controller capable of coupling a plurality of queue heads to a frame list,

wherein the plurality of queue heads are coupled to the frame list before any split-isochronous transaction descriptors where split-isochronous transaction descriptors are supported.

- 2. The apparatus of claim 1, further including a host controller driver.
- 3. The apparatus of claim 1, wherein the plurality of queue heads are coupled to the frame list before any transaction descriptors during initialization of the host controller.
- 4. The apparatus of claim 1, wherein the plurality of queue heads are coupled to the frame list before any transaction descriptors after initialization of the host controller.
- 5. The apparatus of claim 1, wherein the transaction descriptors are split-isochronous transaction descriptors.
- 6. The apparatus of claim 1, wherein the host controller is a universal serial bus (USB) host controller.
- 7. The apparatus of claim 6, where the host controller is a USB 2.0 host controller.
 - 8. A system comprising:
- a first host controller and a second host controller, said first host controller capable of coupling a plurality of queue heads to a frame list, and

a device coupled to said first and second host controllers,

wherein the plurality of queue heads are coupled to the frame list before any split-isochronous transaction descriptors where split-isochronous transaction descriptors are supported.

9. The system of claim 8, further including:

Express Mail No: EV339913355US

042390.P11441D

a first host controller driver associated with said first host controller, and

a second host controller driver associated with said second host controller.

- 10. The system of claim 8, wherein the plurality of queue heads are coupled to the frame list before any transaction descriptors during initialization of the first host controller.
- 11. The system of claim 8, wherein the plurality of queue heads are coupled to the frame list before any transaction descriptors after initialization of the first host controller.
- 12. The system of claim 8, wherein the transaction descriptors are splitisochronous transaction descriptors.
- 13. The system of claim 8, wherein the first host controller and the second host controller are universal serial bus (USB) host controllers.
- 14. The system of claim 13, where the first host controller is a USB 2.0 host controller.
